BTC 8-Hour Market Report

Sun 01 Nov 2026, 07:50 Malaysia time (23:50 UTC)

BTC ~ $77,500

CoinGecko: 24h ~flat, 7d -3.3%, Oct -7.4%

Quick view	**Bias:** Neutral-cautious; range below $80k	**Next 24h range:** $76,300 - $79,000	**Key floor:** $76,400-76,500 (hack low / 200-day EMA)	**Big event:** Binance withdrawals restart (phased) Sun 1 Nov

1. Options - next 24 hours and upcoming expiries

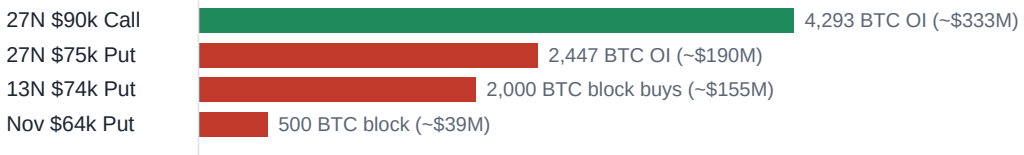
- **Next expiry:** Deribit daily, **Sun 1 Nov 4:00pm MYT** (08:00 UTC). The Mon 2 Nov daily (4:00pm MYT) falls just outside the 24h window.
- **How big:** daily books are small after Friday's $10.9B October monthly cleared; strike-level data for the 1 Nov daily was not readable this run, so treat it as too small to steer price.
- **Expiry that matters this week:** the **Fri 6 Nov weekly ($1.29B, max pain $80,000)**, which also lands on US jobs-report day. The 27 Nov monthly ($3.55B) and 25 Dec quarterly ($10.54B) are the larger magnets.

Expiry	Largest position seen	Size	Meaning
1 Nov daily (4pm MYT)	Not readable this run	Small (est.)	Little pinning power; spot and Binance news dominate
6 Nov weekly - calls	$90k and $95k calls (largest call blocks)	Part of $1.29B total	Far out of the money; only matter if BTC rallies above $82k
6 Nov weekly - puts	$74k and $76k puts (heaviest)	Part of $1.29B total	Hedging demand right under spot; dealer selling can speed a break of $76k
13 Nov - put block	$74k puts (two 1,000 BTC blocks)	2,000 BTC (~$155M)	Fresh downside protection bought during the hack sell-off

Upcoming expiries

Expiry (Malaysia time)	Notional	Put/Call	Max pain	Largest strikes
Sun 1 Nov, 4:00pm (daily)	Small (n/a)	n/a	n/a	Not readable this run
Fri 6 Nov, 4:00pm (weekly)	$1.29B	n/a	$80,000	Calls $90k/$95k; puts $74k/$76k
Fri 27 Nov, 4:00pm (monthly)	$3.55B	0.66	$80,000	$90k call 4,293 BTC; $75k put 2,447 BTC
Fri 25 Dec, 4:00pm (quarterly)	$10.54B	n/a	$75,000	n/a
Fri 30 Oct (expired)	$10.92B	0.53	$78,000	Settled $78,119 - right at max pain

Largest November positions seen (BTC open interest / block size, USD at $77.5k)



How options affect the market now

- **Max pain pull is upward but weak:** both the 6 Nov weekly and 27 Nov monthly have max pain at $80,000, about 3% above spot. Into Friday that is a mild magnet, not a force - the weekly is only $1.29B.
- **Put wall $74k-76k:** traders bought roughly $590M of puts (mostly $74k-78k strikes) during the Binance hack. Dealers who sold them are short gamma there, so a clean break of $76,400 could force hedge selling and speed the move toward $75k/$74k.
- **Sentiment flip:** the October book was call-heavy (P/C 0.53), but 24h options volume after the hack ran 1.63 puts per call and skew moved toward puts. The November monthly P/C of 0.66 is still call-leaning, so upside optionality has not been abandoned.

- **Calls far away:** the big $90k/$95k calls are 16%+ out of the money - no call wall is pressing near spot, so rallies meet spot sellers at $78.5k-80k rather than options resistance.
- **Volatility:** DVOL spiked from ~37 to ~42 on the hack and eased to 38.7 (Oct 30). That implies a ~2.0% (~$1,570) daily move - consistent with a $76k-79k range today unless Binance news surprises.
- **Next-24h expiry:** the 1 Nov daily is not big enough to matter; the weekend is driven by Binance's withdrawal restart and thin liquidity.

Data note: the Deribit public API (index, DVOL, book summary) could not be fetched this run, so strike sizes are the largest seen in published reports (BigGo/Tokenist/Coinpedian, 30 Oct). DVOL 38.7 is the latest published value (30 Oct), not live. P/C and max pain for the 1 Nov daily are unavailable.

2. Price action and key levels

- BTC trades near **$77,500**, about flat over 24h after a 30 Oct crash from ~$80,850 to a **$76,443-76,500 low** (lowest since 18 Sep) triggered by the $6.3B Binance hot-wallet hack.
- The low held just above the **200-day EMA (~$76,468)**; the 24h range has been tight at **$76,338-77,604** (CoinGecko).
- October closed around **$77,200-77,500**, roughly -7% for the month, after strong September ETF inflows (+$2.65B) turned to an October net outflow.
- Price is below the 50-day EMA (~$80,593) and the $80k level it lost on 30 Oct - short-term trend is down, longer-term trend (above 200-day) still intact.

Type	Level	Why it matters
Resistance 2	$80,000-80,600	Max pain for 6 Nov and 27 Nov; 50-day EMA; level lost on 30 Oct
Resistance 1	$78,500-79,000	First recovery zone; post-crash bounce highs
Pivot	$77,500-78,000	Current price; 30 Oct expiry settled $78,119 (max pain $78k)
Support	$76,400-76,500	Hack low and 200-day EMA; dealer short-gamma zone below
Deep risk	$75,000 then $73,000-74,000	$75k/$74k put strikes, 15 Sep low $74,968; $73k next

3. Derivatives, flows and sentiment

Metric	Latest	Read
Futures OI (all venues)	$53.2B (Coinglass, live)	Leverage still high; aggregate OI fell only ~3% in the crash
Funding (one venue snapshot)	0.0100% / 8h	Neutral-positive; longs still paying, no capitulation
Long/short (same venue)	72% long / 28% short	Crowded long - fuel for a flush if $76.4k breaks
Liquidations (30 Oct, 24h)	~$1.53-1.57B, ~84% longs	Big long flush done; BTC ~$500M of it
Spot BTC ETF flows	30 Oct: -$643M; week -$202M	Worst day since June; October net ~-$515M
Fear & Greed	31 (Fear), 31 Oct	Up from 29; down from 50 before the hack
DVOL (implied vol)	38.7 (30 Oct)	~2.0% implied daily move; eased from 42 peak

4. News and macro

- **Binance hack:** ~$6.3B taken from a hot wallet on 29 Oct (TRM Labs attributes it to North Korea). Binance says ~90% of losses are covered and ~$3B is frozen; **phased withdrawal restart targeted for Sun 1 Nov**, proof-of-reserves results by Mon 2 Nov.
- **On-chain watch:** ~18,270 BTC sit in 19 attacker wallets (17 with exactly 1,000 BTC); none had moved as of 30 Oct. Any movement toward exchanges/mixers is a supply-fear risk.
- **ETF outflows:** US spot BTC ETFs lost $643M on 30 Oct (IBIT -$234M, FBTC -$201M); total ETF assets dipped below $100B ($98.1B).

- **Fed:** held at 3.75-4.00% on 28 Oct with two hawkish dissents (favoring a hike); described activity as 'strong'. Next FOMC 8-9 Dec.
- **Equities:** Nasdaq fell over 3% on 30 Oct on AI-capex worries; crypto remains tied to tech risk appetite.
- **Clock change:** US daylight saving ends 1 Nov, so US 8:30am ET data now lands at **9:30pm MYT**.

Event calendar (Malaysia time)

When (MYT)	Event
Sun 1 Nov, 4:00pm	Deribit daily options expiry
Sun 1 Nov (time TBC)	Binance phased withdrawal restart
Mon 2 Nov	Binance proof-of-reserves results expected
Tue 3 Nov	US midterm elections
Fri 6 Nov, 4:00pm	Weekly options expiry ($1.29B, max pain $80k)
Fri 6 Nov, 9:30pm	US jobs report (Oct payrolls)
Tue 10 Nov, 9:30pm	US CPI (Oct)
Fri 13 Nov, 9:30pm	US PPI; 13 Nov expiry (large $74k puts)
Tue 17 Nov, 9:30pm	US retail sales
Thu 19 Nov, 3:00am	FOMC minutes (27-28 Oct meeting)
Fri 27 Nov, 4:00pm	Monthly options expiry ($3.55B, max pain $80k)
Thu 10 Dec, 3:00am	FOMC decision (8-9 Dec meeting)

5. Summary and prediction

BTC is stabilising around $77,500 after the Binance hack flush, holding just above the $76.4k-76.5k hack low and 200-day EMA. Options positioning is two-sided: max pain for both the weekly and monthly sits at $80k (a mild upward pull), but fresh $74k-76k put buying means dealers are short gamma just below spot, so a break of $76.4k could accelerate. Leverage is still long-heavy (funding positive, 72% longs on one venue) and ETFs bled $643M on Friday, so upside needs a catalyst - the most likely one is a clean Binance withdrawal restart today. Weekend liquidity is thin and the 1 Nov expiry is too small to pin price. **24h call: range-bound $76,300-79,000 with a slight upside lean if Binance withdrawals reopen smoothly; a close below $76,400 flips risk to $75k-74k.**

Scenario	Chance	Range	Trigger
Base: range	50%	$76,300 - $79,000	Withdrawals restart without incident; weekend chop around $77.5-78k
Bullish: relief	25%	$78,500 - $81,000	Smooth Binance reopen + strong proof of reserves; hourly close above $78.5k, then test $80k max pain
Bearish: break	25%	$74,500 - $76,400	Withdrawal delay, hacker BTC moving, or Monday risk-off; close below $76.4k triggers put-hedge selling

- **Bull signal:** 4h close above $78,500 with funding steady - opens $80k (max pain / 50-day EMA).
- **Bear signal:** 4h close below $76,400 or movement from the 1,000-BTC hacker wallets - opens $75k then $74k put strikes.
- Next report: 3:50pm MYT, Sun 1 Nov
