BTC 8-Hour Market Report

Wednesday 14 Oct 2026, 15:50 Malaysia time (07:50 UTC)

BTC ~ $83,400

CoinDesk ticker; 24h roughly flat (-0.25% to +1%)

Quick view	**Bias:** Neutral, event-driven (US CPI tonight)	**Next 24h range:** $81,500 - $85,500	**Key floor:** $81,000 - $82,000, then the $80k put wall	**Big event:** US Sept CPI, today 8:30pm MYT

1. Options - next 24 hours and upcoming expiries

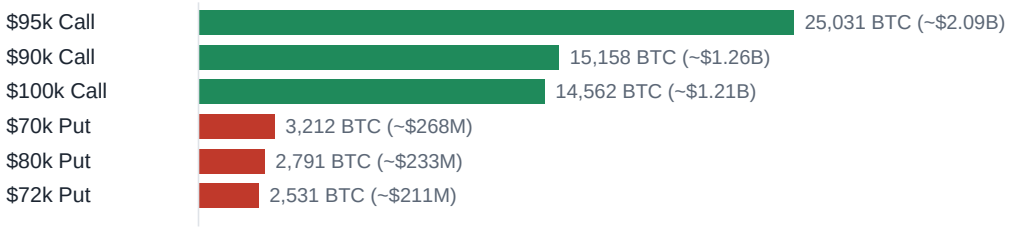
- **Next expiry:** today's daily (14OCT26) settles at 4:00pm MYT, minutes after this report; the next one is the Thu 15 Oct daily at 4:00pm MYT. Daily expiries are small and should not move price by themselves.
- **How big:** no reliable size data for the dailies this run. The Fri 16 Oct weekly holds about 15,000-15,500 BTC (~$1.28B) with a put-heavy P/C of 1.43-1.50 and max pain at $83,000, almost exactly spot.
- **Which expiry matters this week:** the Fri 16 Oct weekly (4:00pm MYT) is the main one for this week. The Fri 30 Oct monthly ($11.7B, call-heavy) is the big one this month and already shapes positioning.

Expiry	Largest position seen	Size	Meaning
15 Oct daily	n/a (feed not readable)	-	Too small to matter on its own; CPI drives the next 24h
16 Oct weekly - put	$80,000 put	~2,260 BTC (~$188M)	Largest hedge; $76k-80k puts total ~$451M, so dealers can push lower if $80k breaks
16 Oct weekly - call	$90,000 call	~1,130 BTC (~$94M)	Upside bets cluster $85k-90k (~$219M); far from spot, weak magnet

Upcoming expiries

Expiry (Malaysia time)	Notional	Put/Call	Max pain	Largest strikes
Thu 15 Oct, 4:00pm (daily)	n/a	n/a	n/a	Not available this run
Fri 16 Oct, 4:00pm (weekly)	~$1.28-1.29B	1.43-1.50	$83,000	Puts $80k (~$188M), $78k (~$162M), $76k (~$101M); calls $90k (~$94M), $87k (~$70M), $85k (~$55M)
Fri 30 Oct, 4:00pm (monthly)	~$11.7B	0.48	$78,000	Calls $95k (25,031), $90k (15,158), $100k (14,562); puts $70k (3,212), $80k (2,791), $72k (2,531) BTC

Fri 30 Oct monthly expiry - largest open interest by strike (BTC; USD at ~$83.4k)



How options affect the market now

- **Pin near $83k:** the weekly max pain ($83,000) sits on spot, so absent a CPI shock, hedging flows tend to pull price back toward $83k into Friday 4:00pm MYT.
- **$80k is the put wall:** about 35% of the weekly is in $76k-80k puts. Above $80k, dealers who sold these puts are relatively calm; a break below would force them to sell futures and could speed up the drop toward $78k.
- **Short-term sentiment is defensive:** weekly P/C of ~1.45 and 7-day 25-delta skew turning negative (-2.4 from +2.0 a week earlier) show traders paying for downside protection into CPI.
- **Monthly is the opposite:** the 30 Oct expiry is call-heavy (P/C 0.48) with a big $95k call wall. Those calls are far out of the money, so they only matter if price runs above $86k-88k, where dealer hedging could add fuel.

- **Volatility:** 7-day at-the-money IV ~32% (Laevitas) implies about +/-1.7% (~$1,400) per day and ~$3,700 per week. CPI could briefly beat that; after Friday's expiry, IV often drops and price can trend more freely.
- **Max pain gap:** monthly max pain is $78k, below spot. It is a weak pull this far out, but it adds to the downside risk if CPI disappoints.

Data note: the Deribit public API (index, DVOL, book summary) could not be reached this run, so options figures come from published articles (Digital Today/Laevitas data of 11 Oct, CryptoTicker 10-12 Oct, TokenPost 12 Oct, Au79 13 Oct) and are 'largest seen'. IV is Laevitas ATM IV, not DVOL. Sizes in USD are approximate.

2. Price action and key levels

- BTC trades around $83,400-83,900 in today's Asian session after touching ~$83,880; CoinDesk says it climbed toward $84,000 after Fed's Williams said he sees no hikes in 2027.
- On Mon 12 Oct BTC dropped from ~$84,200 to ~$81,382 with $771M liquidated (89% longs), then recovered above $83,000 on Tuesday.
- Since the August low it has held a roughly $81,000-86,000 range; $84,000 (with the 4h 50-period MA) has rejected several pushes.
- Momentum is mixed: daily MACD has a bearish cross, RSI ~53 is neutral.

Type	Level	Why it matters
Resistance 2	$86,000 - $87,000	Top of the post-August range; weekly $87k calls; a break opens $88k-90k
Resistance 1	$84,000 - $84,500	Repeated rejections, 50-period MA; 4h close above it is the bull trigger
Pivot	$83,000	Weekly max pain and daily/weekly chart pivot
Support	$81,000 - $82,000	Monday's liquidation low ($81,382) held; buyers defended
Deep risk	$78,000 - $80,000	$80k is the largest weekly put; $78k is monthly max pain and the hot-CPI target

3. Derivatives, flows and sentiment

Metric	Latest	Read
Futures open interest	~$52.7B (from $54.5B)	Leverage flushed on Monday; less fuel for another cascade
Funding rate	~0.003-0.009% per 8h, near flat	Neutral; no crowded long or short
Liquidations (24h to 13 Oct)	$771M, 89% longs	Longs already washed out
Spot BTC ETF flows	Oct 12: -$65.4M; Oct 5-9 week: -$681M; MTD -$454M	Institutions selling; Oct 13 data not yet seen
Implied vol (7d ATM)	~32% (30d ~34.7%)	Calm pricing into CPI; ~+/-$1,400 per day
Fear & Greed	56-62 (KuCoin, AnalyticsInsight); 40 per Au79	Mixed, roughly neutral

4. News and macro

- **US CPI tonight:** September CPI at 8:30pm MYT. Consensus headline +0.6% m/m (3.6-3.7% y/y vs 3.4%), core +0.2% m/m. Core at 0.3% or higher would be hawkish.
- **Fed:** rates were hiked 25bp in September to 3.75-4.00%. FedWatch shows ~77% for no change at the 27-28 Oct FOMC; NY Fed's Williams sees possibly one more 2026 hike but none in 2027. 10-year yields are above 5.1%.
- **Geopolitics/oil:** reports of US-Israel talks on a possible strike on Iran; Brent around $106 and WTI up four sessions, adding inflation risk.

- **Regulation:** South Korea moved to block 27 unregistered overseas exchanges (including KuCoin and BitMart); Russia's Sberbank won approval to offer crypto trading from 1 Dec.
- **Security/flows:** Ledger confirmed tampered wallets sold via a distributor; an early whale moved 4,582 BTC (~$378M); Strive is raising $500M for more BTC and Strategy bought 250 BTC.

Event calendar (Malaysia time)

When (MYT)	Event
Wed 14 Oct, 8:30pm	US September CPI
Thu 15 Oct, 4:00pm	Deribit daily expiry; G20 meeting (15 Oct)
Thu 15 Oct, 8:30pm	US September PPI
Fri 16 Oct, 4:00pm	Deribit weekly expiry (~$1.28B, max pain $83k); Fed Chair Warsh remarks later Friday
Wed 21 Oct	Solana Alpenglow upgrade
Thu 29 Oct, 2:00am	FOMC decision (27-28 Oct meeting); Strategy Q3 earnings 29 Oct
Fri 30 Oct, 4:00pm	Deribit monthly expiry (~$11.7B, max pain $78k, $95k call wall)

5. Summary and prediction

BTC is stuck in the middle of its $81k-86k range, sitting on the weekly max pain at $83k, with leverage already flushed by Monday's $771M liquidation. Options positioning is defensive for this week (P/C ~1.45, negative skew, puts at $76k-80k), while ETF outflows remain a headwind. Tonight's CPI is the deciding event: an in-line or soft core print likely keeps BTC pinned near $83k-84k into Friday's expiry, a clean 4h close above $84,500 opens $86k-87k, and a hot core print (0.3%+) risks a test of $81k and the $80k put wall. **24h call: range-bound $81,500-85,500, slight upside lean if core CPI is 0.2% or lower.**

Scenario	Chance	Range	Trigger
Base: CPI pin	50%	$82,000 - $84,800	CPI near consensus; max pain $83k holds price into Friday
Bullish	25%	$84,500 - $87,000	Core CPI 0.2% or lower; 4h close above $84,500 with ETF inflows returning
Bearish	25%	$79,500 - $82,000	Hot core CPI (0.3%+) or oil/Iran shock; loss of $81,000 brings the $80k put wall into play

- Bull signal: 4h close above $84,500 after CPI, ideally with rising spot volume and positive ETF flow.
- Bear signal: hourly close below $81,000; below $80,000 dealer put hedging can accelerate selling toward $78k.
- Next report: 11:50pm MYT (Wed 14 Oct), after the CPI release.
