BTC 8-Hour Market Report

Tuesday 13 Oct 2026, 15:50 Malaysia time (07:50 UTC)

BTC ~ $83,800

Multi-source; 24h ~flat after $81k dip; 7d ~-3%

Quick view	**Bias:** Neutral, range-bound into CPI	**Next 24h range:** $82,500 - $84,500	**Key floor:** $81,000 then $80,000 put wall	**Big event:** US CPI Wed 14 Oct, 8:30pm MYT

1. Options - next 24 hours and upcoming expiries

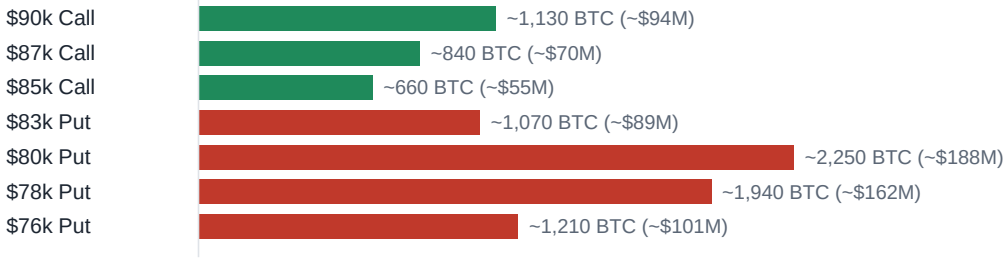
- **Next expiries:** Deribit daily today Tue 13 Oct at 4:00pm MYT (minutes after this report) and Wed 14 Oct at 4:00pm MYT. Both settle **before** Wednesday's CPI (8:30pm MYT). Strike detail for the daily books could not be read this run.
- **How big:** daily books are usually small relative to the weekly; no published notional found. Implied daily move from 7-day ATM IV ~32% is about 1.7% (~$1,400), so the options market prices roughly $82,400 - $85,200 as a 1-sigma day.
- **Which expiry matters this week:** Friday 16 Oct 4:00pm MYT (~15,500 BTC, ~$1.3B, put-heavy, max pain $83,000) because it settles after CPI and PPI. The monthly 30 Oct (~$11.7B) is the giant of the month.

Expiry	Largest position seen	Size	Meaning
13 Oct / 14 Oct daily (4pm)	Not readable this run	n/a	Small books; dealer flows from the weekly and monthly matter more.
16 Oct weekly	$80,000 Put	~$188M (~2,250 BTC)	Main floor for the week; hedgers tend to buy dips toward $80k, but a clean break can speed selling.
16 Oct weekly	$90,000 Call	~$94M (~1,130 BTC)	Upside cap far away; $85k-$87k calls ($55M/$70M) are the nearer lids.

Upcoming expiries

Expiry (Malaysia time)	Notional	Put/Call	Max pain	Largest strikes
Tue 13 Oct 4:00pm (daily)	n/a	n/a	n/a	Not readable this run
Wed 14 Oct 4:00pm (daily)	n/a	n/a	n/a	Not readable this run
Fri 16 Oct 4:00pm (weekly)	~$1.29B (15,502 BTC)	1.43	$83,000	Puts $80k ~$188M, $78k ~$162M, $76k ~$101M; calls $90k ~$94M, $87k ~$70M
Fri 30 Oct 4:00pm (monthly)	~$11.7B (140,844 BTC)	0.48	$78,000	Call $95k 25,031 BTC (~$2.1B); put $70k 3,212 BTC, $80k 2,791 BTC
Fri 25 Dec 4:00pm (quarterly)	n/a	n/a	n/a	Not yet in focus

Fri 16 Oct weekly - largest open interest seen (Deribit, 12 Oct snapshot)



How options affect the market now

- **Pin toward $83,000:** the weekly's max pain sits at $83k, right under spot. With CPI and PPI ahead, a drift back toward $83k-$84k into Friday is the path of least pain for option sellers.
- **Put wall $76k-$80k:** about $451M of weekly puts sit there. Dealers who sold these puts buy spot as price falls toward $80k (support), but if $80k breaks they can be forced to sell more, so a break could accelerate.
- **Put/call 1.43 on the weekly:** traders are paying for downside protection into CPI; short-dated 25-delta skew flipped to about -2.4 to -3 vols (puts richer). This is caution, not panic.

- **Volatility is cheap-ish:** 7-day ATM IV ~32% vs 7-day realised ~30%. Options are not pricing a big shock; a hot or cold CPI could therefore move price more than implied.
- **Monthly overhang:** the 30 Oct expiry has a huge $95k call stack and max pain $78k, a day after the FOMC. It matters later in the month, not in the next 24h.
- **Today's daily expiry is not big enough to matter** on its own; expect any post-4pm moves to be driven by spot flows and macro, not settlement.

Data note: the Deribit public API (index, DVOL and book summary) could not be accessed this run, so DVOL and daily-expiry strike data are missing. Weekly figures come from CryptoSlate (12 Oct snapshot) and monthly figures from CryptoTicker (updated 12 Oct); BTC sizes are converted from USD notional and are approximate - treat them as 'largest seen'.

2. Price action and key levels

- BTC slid from ~$83,900 to an overnight low near $81,000 (early 13 Oct MYT) as about $0.5-0.8B of crypto positions were liquidated, mostly longs.
- It then rebounded back above $83,000 during the Asian session and traded around $83,700-$83,900 into 4pm MYT, roughly flat on 24h.
- The week is still about -3%: BTC opened the prior week near $87,000 and printed a low near $80,400 last Thursday.
- Momentum is mixed: daily RSI ~47; the 13-week EMA crossed above the 34-week EMA (longer-term positive), but the dollar and yields are pressing risk assets.

Type	Level	Why it matters
Resistance 2	$85,000 - $87,000	Weekly $85k/$87k call strikes; $87k-$88k was last week's breakdown zone.
Resistance 1	$84,300 - $84,500	24h high ($84,352) and Bollinger mid-band; repeated rejections here.
Pivot	$83,000 - $83,600	Weekly max pain $83k and daily pivot ~$83,590; holding above keeps the range intact.
Support	$81,000 - $81,300	Overnight low and 50-day SMA area; buyers defended it twice.
Deep risk	$80,000 then $78,000	Largest weekly put ($80k), approx. ETF holder cost basis; $78k is a put strike and the monthly max pain.

3. Derivatives, flows and sentiment

Metric	Latest	Read
Futures open interest	~$50.9B (CoinGlass); ~-7% w/w	Leverage has been flushed, which lowers cascade risk.
Funding (perps)	~+0.001% per 8h	Neutral; no crowded side.
Liquidations (24h to early 13 Oct)	~$490M-$770M total, ~85% longs	Long flush on the dip to $81k; BTC share ~$107M (CoinGlass).
Long/short ratio	~1.64	Retail still leaning long.
Spot BTC ETF flows	Fri 9 Oct -$485M; week 5-9 Oct -$681M	Biggest weekly outflow since June; Monday 12 Oct figure not yet seen.
Options IV / skew	7d ATM ~32%, 30d ~35%; 25d skew ~-2.4 to -3	Mild put demand into CPI; vol not stressed.
Fear & Greed	57 (Greed), down from 69	Sentiment cooled but not fearful.

4. News and macro

- **CPI nerves:** US September CPI lands Wed 14 Oct (8:30pm MYT); median forecast core +0.21% m/m vs 0.29% in August. PPI and retail sales follow Thursday.
- **Hawkish Fed backdrop:** the Fed hiked in September; minutes show most officials expect another hike this year. October hike odds ~18-20%, December favoured. Cleveland Fed's Hammack sounded hawkish; Chair Warsh speaks Friday.

- **Dollar and yields:** DXY ~102.5 (18-month high), US 10-year above 5% after touching 5.36% last week. Brent ~$103-106 after a tanker attack in the Strait of Hormuz; Iran rejected the US response on reopening the strait.
- **ETF outflows:** spot BTC ETFs lost ~$681M last week, the first weekly outflow since early September.
- **Supply/on-chain:** a whale dormant since 2020 moved ~4,500 BTC (~$378M). Strategy added 250 BTC (now ~848,250 BTC).
- **Regulation:** South Korea moved to block 27 unregistered overseas exchanges; Korean banks launched first BTC-backed loans.

Event calendar (Malaysia time)

When (MYT)	Event
Tue 13 Oct, 4:00pm	Deribit daily options expiry
Wed 14 Oct, 4:00pm	Deribit daily options expiry
Wed 14 Oct, 8:30pm	US CPI (September)
Thu 15 Oct, 8:30pm	US PPI and retail sales (September)
Fri 16 Oct, 4:00pm	Deribit weekly expiry (~$1.3B, max pain $83k)
Fri 16 Oct (US time)	Fed Chair Warsh speech
Thu 29 Oct, 2:00am	FOMC rate decision (27-28 Oct meeting)
Thu 29 Oct, 8:30pm	US Q3 GDP (advance) and September PCE
Fri 30 Oct, 4:00pm	Deribit monthly expiry (~$11.7B, max pain $78k)

5. Summary and prediction

BTC has fully recovered last night's long-liquidation dip to ~$81,000 and sits near $83,800, just above the weekly max pain of $83,000. Leverage has been cleaned out (OI down, funding neutral), but macro is heavy: the dollar is at an 18-month high, the 10-year is above 5%, the Fed is still hiking and ETFs are bleeding. Options show cautious put demand ($76k-$80k wall) yet modest implied volatility. Today's 4pm daily expiry is small. The next 24 hours end before Wednesday's CPI, so the most likely outcome is a pinned, two-way range between roughly $82,500 and $84,500, with the real move saved for CPI. **24h call: range $82,500-$84,500, neutral; a break of $84,500 or $82,500 sets the next leg.**

Scenario	Chance	Range	Trigger
Base: pre-CPI chop	55%	$82,500 - $84,500	No new macro shock; pin toward $83k-$84k max pain zone; ETF flows mixed.
Bullish: range breakout	20%	$84,500 - $86,000	Hourly close above $84,500 with rising spot volume / ETF inflows; shorts cover toward $85k-$86k calls.
Bearish: retest lows	25%	$80,800 - $82,500	Loss of $82,500 on dollar/yield spike, oil or Hormuz headlines, or another big ETF outflow; $81k then $80k put wall.

- Clean upside signal: 4h close above $84,500 with funding staying near neutral (spot-led, not leverage-led).
- Clean downside signal: hourly close below $82,500 and then $81,000; below $80,000 the put wall turns into an accelerant.
- Next report: 11:50pm MYT (Tue 13 Oct)
